Boltzman and von Neuman entropy formulas – reminder

The entropy S of macrostate is given by the log of number W of distinct microstates that compose it

$$S = - \sum_{i=1}^W p(i) \ln p(i) \quad \text{Gibbs entropy}$$

For uniform distribution $p(i) = \frac{1}{W}$ the entropy is maximal Boltzmann entropy
 $S = \ln W$

Since partons are introduced as the microscopic constituents that compose the macroscopic state of the proton, it is natural to evaluate the corresponding entropy or entropy corresponding to parton density.

K. Kutak '11, Peschanski'12
 A. Kovner, M. Lublinsky '15
 D. Kharzeev, E. Levin '17,...

But proton as a whole is a pure state and the von Neuman entropy is 0. Can one get any nontrivial result?

For pure state (one state) density matrix is: For mixed state i.e. classical statistical mixture

$$\rho = |\psi\rangle\langle\psi|$$

$$S_{VN} = -Tr[\rho \ln \rho] = -1 \ln 1 = 0$$

$$\rho = \sum p(i) |\psi_i\rangle\langle\psi_i|$$

$$S_{VN} \neq 0$$

Kharzeev, Levin '17

Entanglement entropy in DIS

The composite system is described by

$$|\Psi_{AB}\rangle \text{ in } A \cap B$$

entangled

if the product can not be expressed as separable product state

$$|\Psi_{AB}\rangle = \sum_{i,j} c_{ij} |\varphi_i^A\rangle \otimes |\varphi_j^B\rangle$$

Schmidt decomposition

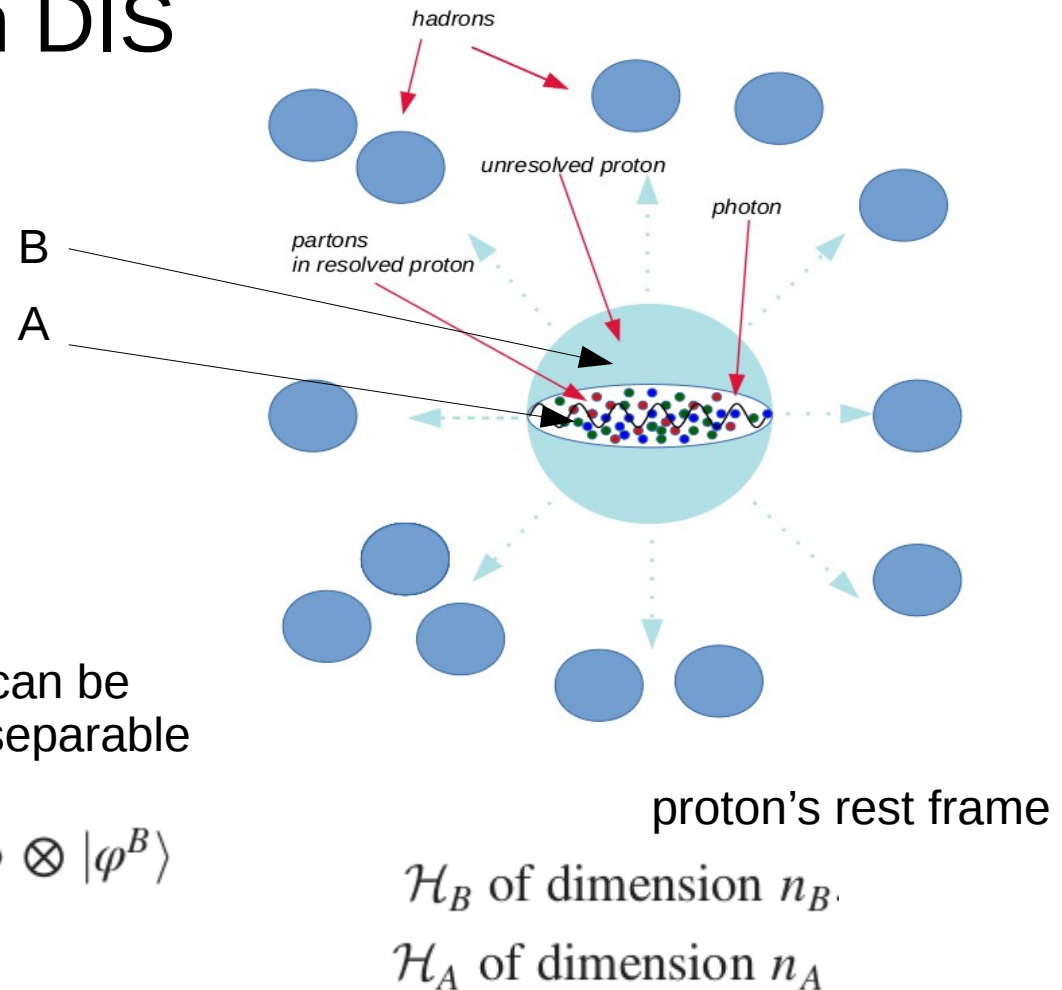

$$|\Psi_{AB}\rangle = \sum \alpha_n |\Psi_n^A\rangle |\Psi_n^B\rangle$$

← orthonormal states belonging to A
 ← orthonormal states belonging to B
 ← related to matrix C

separable

if the product can be expressed as separable product state

$$|\Psi_{AB}\rangle = |\varphi^A\rangle \otimes |\varphi^B\rangle$$

Khazzeev, Levin '17

Entanglement entropy in DIS

$$|\Psi_{AB}\rangle = \sum_n \alpha_n |\Psi_n^A\rangle |\Psi_n^B\rangle$$

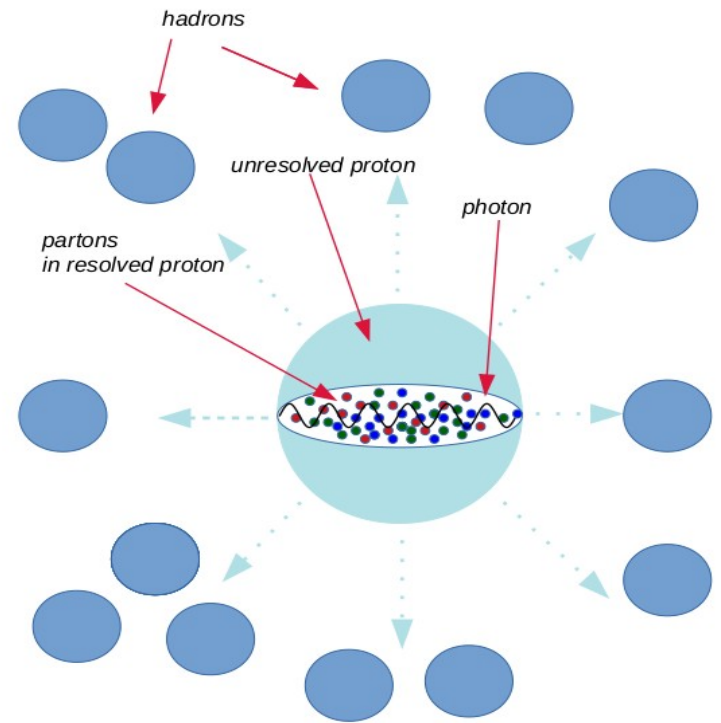

$$\rho_{AB} = |\Psi_{AB}\rangle \langle \Psi_{AB}|$$

$$\rho_A = \text{tr}_B \rho_{AB} = \sum_n \alpha_n^2 |\Psi_n^A\rangle \langle \Psi_n^A|$$

$\alpha_n^2 \equiv p_n$ probability of state with n partons

$$S = - \sum_n p_n \ln p_n$$

entropy results from the entanglement between the regions A and B, and can thus be interpreted as the entanglement entropy. Entropy of region A is the same as entropy in region B.

The density matrix of the mixed state probed in region A

Khazzev, Levin '17

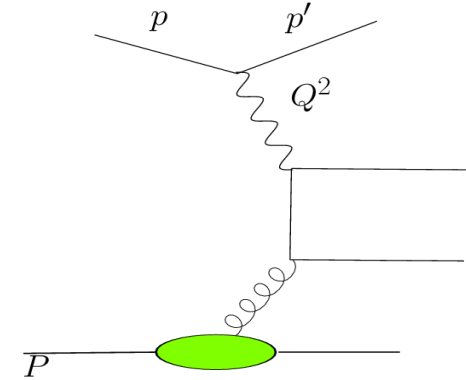

Proton structure function and dipole cross section

$$F_2(x, Q^2) = \frac{Q^2}{4\pi^2} \alpha_s \sum_q e_q^2 \int d^2k \mathcal{F}(x, k^2) (S_L(k^2, Q^2, m_q^2) + S_T(k^2, Q^2, m_q^2))$$

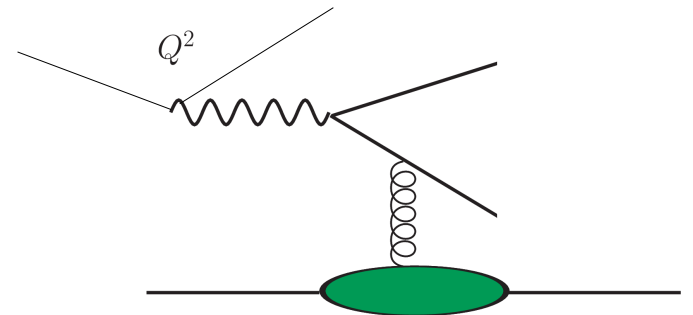

dipole gluon density

impact factors ~ hard coefficients

In the kt factorization

In the dipole formalism

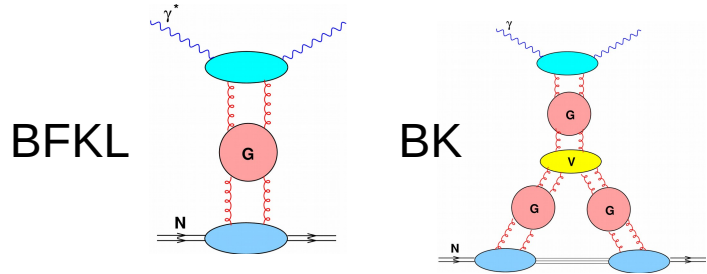

$$F_2(x, Q^2) = \frac{Q^2}{4\pi^2 \alpha_{em}} \int d^2b \int_0^1 dz \int d^2r (|\psi_L(z, r)|^2 + |\psi_T(z, r)|^2) N(x, r, b)$$

wave function

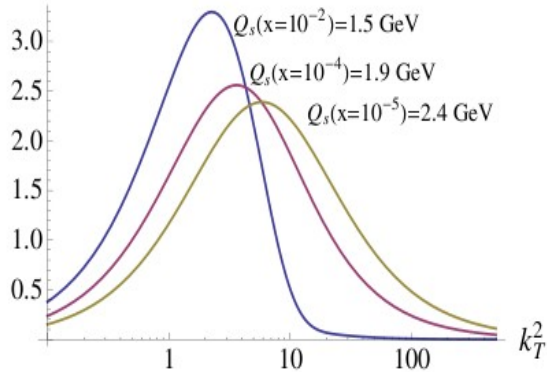

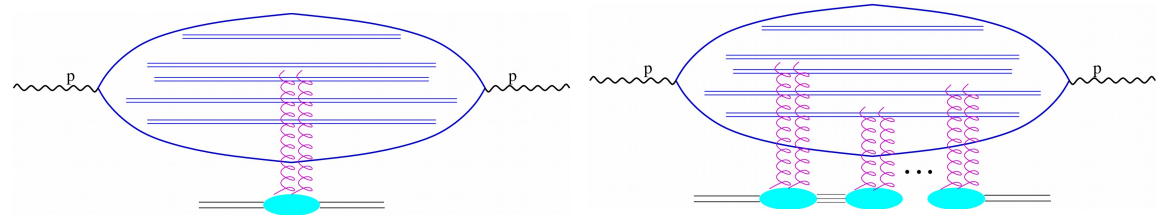

dipole amplitude

Momentum space vs coordinate space

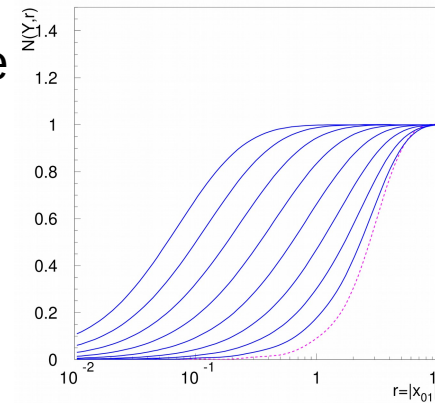

momentum space - Bjorken frame

position space - Mueller frame

gluon ~ color dipole

Acta Phys.Polon.
B35 (2004) 3069-3102

$$\mathcal{F}(x, k) = \mathcal{F} + K_{ms} \otimes \mathcal{F}(x, k) - \frac{1}{R^2} TPV \otimes \mathcal{F}(x, k)^2 \quad N(x, r, b) = N_0 + K_{ps} \otimes (N(x, r, b) - N(x, r, b)^2)$$

dipole unintegrated gluon density

related by Fourier transform

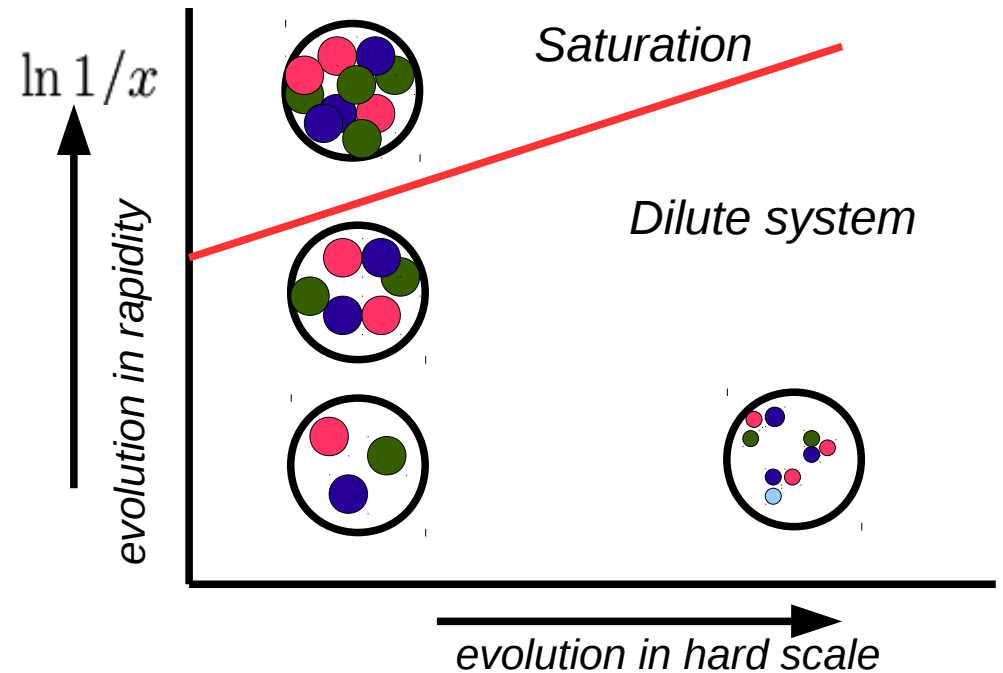

Evolved with BK dipole amplitude – expectation value of product of Wilson lines in fundamental representation

Gluons at high energies

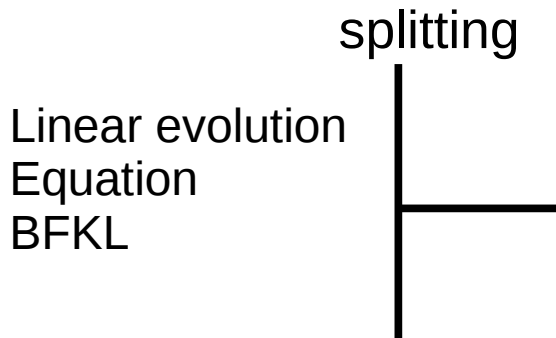

Saturation – state where number of gluons stops growing due to high occupation number. Way to fulfill unitarity requirements in high energy limit of QCD.

L.V. Gribov, E.M. Levin, M.G. Ryskin
 Phys.Rept. 100 (1983) 1-150

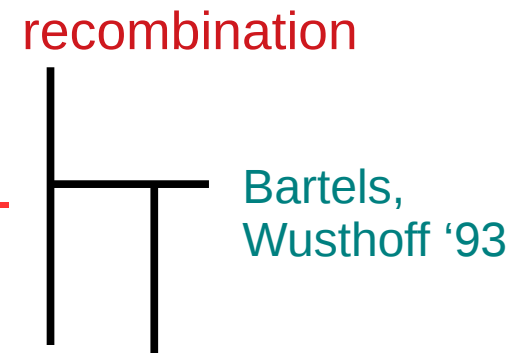

Larry D. McLerran, Raju Venugopalan
 Phys.Rev. D49 (1994) 3352-3355

On microscopic level it means that
 gluon apart splitting recombine

Jailian-Marian, Iancu
 McLerran, Weigert, Leonidov, Kovner

The dipole cross section and integrated gluon

$$N(x, r) \approx xg(x, 1/r^2)$$

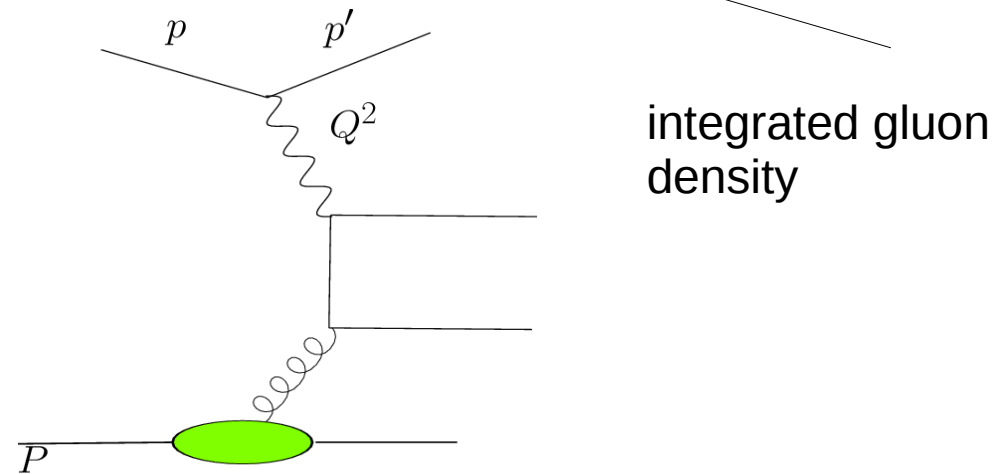

For fixed dipole size one has.

$$N(x) = 1 - Z(x)$$

$$Z(x) \propto \sum_n P_n$$

generating function for dipoles

$$xg(x, Q^2) \equiv \int^{Q^2} dk^2 \mathcal{F}(x, k^2)$$

integrated gluon density

In the context of the scale dependent GBW model this approximation is viewed as linear approximation

Partonic, dipole cascade

$$p_n = P_n$$

$$\frac{dP_n(Y)}{dY} = -\lambda n P_n(Y) + (n-1)\lambda P_{n-1}(Y)$$

set of partons is described by set of dipoles with fixed sizes, Y is rapidity and is related to energy
 Mueller 95, Lublinsky, Levin '03

$$P_n(Y) = e^{-\lambda Y} (1 - e^{-\lambda Y})^{n-1}$$

depletion of the probability to find n dipoles due to the splitting into $(n+1)$ dipoles.

$$S = -\sum_n p_n \ln p_n$$

the growth due to the splitting of $(n-1)$ dipoles into n dipoles.

$$S(Y) \approx \lambda Y \quad \text{where} \quad Y = \ln 1/x$$

model of BFKL dipole cascade

$$\langle n \rangle = \sum_n n P_n(Y) = \left(\frac{1}{x}\right)^\lambda$$

BFKL intercept = $4 \ln 2 \bar{\alpha}_S$

Khazzeev, Levin '17

Assumption $\langle n \rangle \equiv xg(x)$

The approach can be generalized to 3+1 d and one can account for hard scale dependence.

Density matrix in 1+1 D Nowak, Liu, Zahed '22

EE in DLL Nowak, Liu, Zahed '23

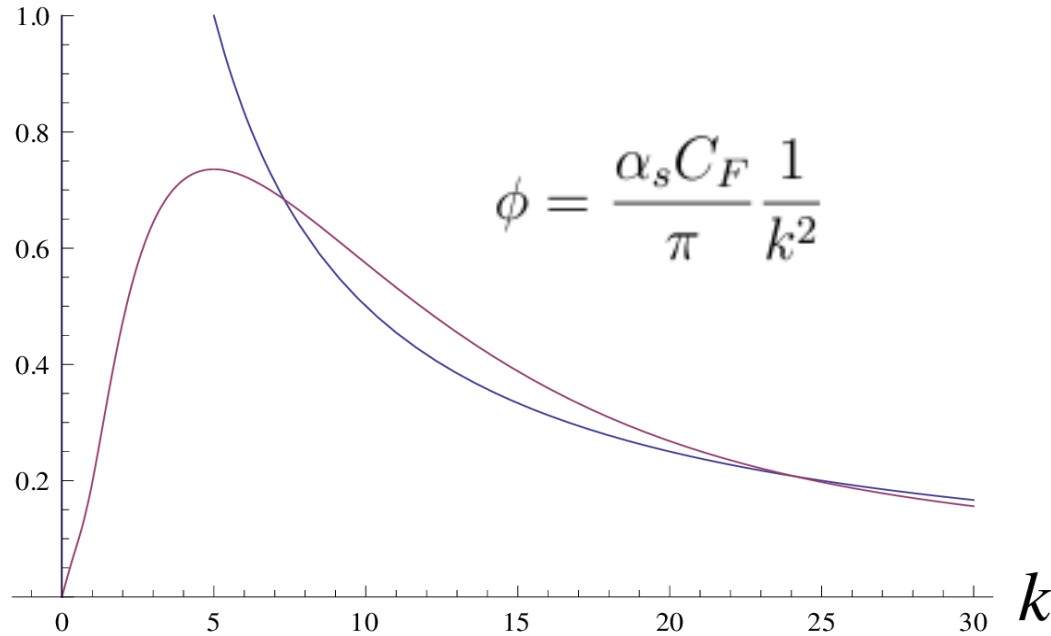

$$S(x) = \ln(xg(x))$$

$$S(x, Q) = \ln(xg(x, Q))$$

Comment: saturation and entropy

Kutak 1103.3654.v1 and v2

$\phi(x, k)$

$$\Delta S = \pi \lambda \Delta y$$

$$\Delta y = \ln(x_0/x)$$

$$Q_s^2 = Q_0^2 (x_0/x)^\lambda$$

Many-body interactions

Medium generated mass of gluon.
Framework of Hard Thermal Loops.

Similarly in QED. Cut on photon's kt
Is equivalent to introducing mass.

In presented approach **mass is not fixed it is x dependent**

Entropy formula - interpretation

$$P_n(Y) = e^{-\lambda Y} (1 - e^{-\lambda Y})^{n-1}$$

At low x partonic microstates have equal probabilities

In this equipartitioned state the entropy is maximal – the partonic state at small x is maximally entangled.

In terms of information theory as Shannon entropy:

- equipartitioning in the maximally entangled state means that all “signals” with different number of partons are equally likely
- it is impossible to predict how many partons will be detected in a give event.
- structure function at small x should become universal for all hadrons.

From strict bounds on entanglement entropy (from conformal field theory) one can obtain that at low x (in conformal regime) one has

$$xg(x) \leq \text{const } x^{-1/3}$$

Khazzeev, Levin '17

Furthermore entropy of the final state hadrons can not be smaller than entropy of partons.

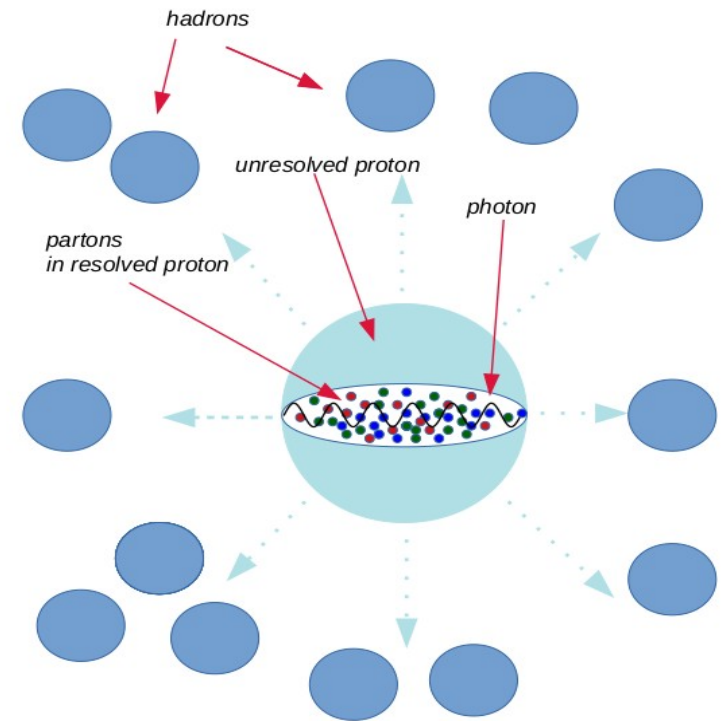

Entanglement entropy – calculation and measurement

For DIS at high energies, this entanglement entropy can be calculated using

$$S(x, Q^2) = \ln \left\langle n \left(\ln \frac{1}{x}, Q \right) \right\rangle$$

$$S_{hadron} = \sum P(N) \ln P(N)$$

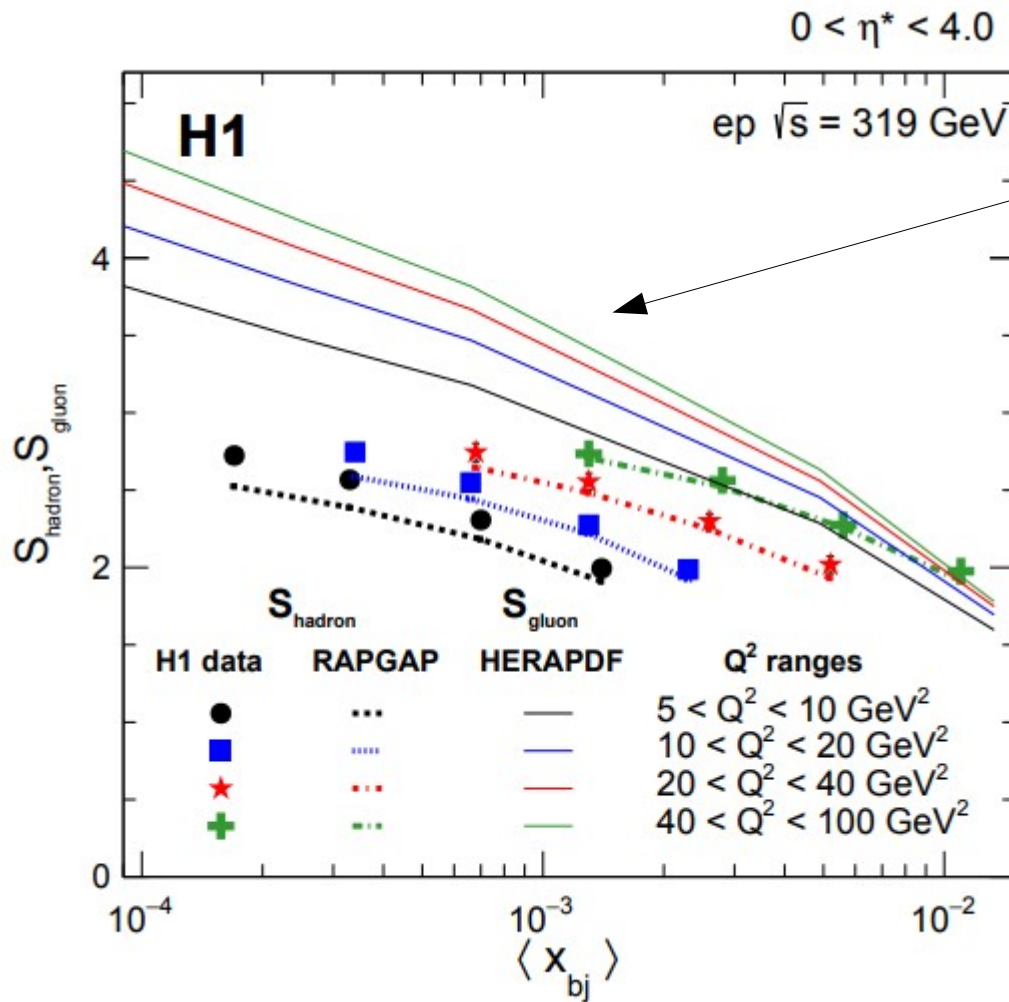

N number of measured hadrons

The charged particle multiplicity distribution measured in either the current fragmentation region or the target fragmentation region.

Fraction of events with charged hadron

Data and EE

HERA pdf used

$$S(x, Q) = \ln(xg(x, Q))$$

 for calculations of EE in p-p.

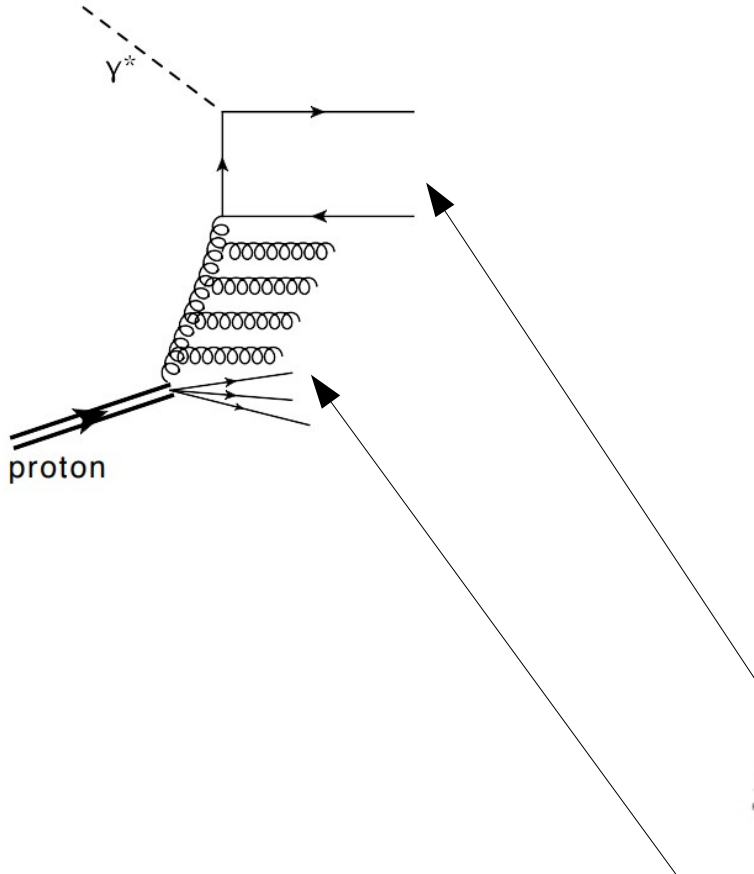

Extension of KL entropy formula

Hentschinski, Kutak '21

$$\left\langle n \left(\ln \frac{1}{x}, Q \right) \right\rangle = xg(x, Q) + x\Sigma(x, Q)$$

To get the entropy of system of partons one needs to account for both quarks and gluons. One can view this as a higher order correction to KL formula. Furthermore it is impossible to isolate quarks from gluons therefore the complete entropy formula should receive contributions from quarks and gluons

Gluon and quark distribution

In the linear regime obeys BFKL equation. In our calculations we use NLO BFKL with kinematical improvements and running coupling. The gluon density has been fitted to F_2 data (exact kinematics was used)

The generalized KL model is used and entropy saturates in this approach and [Nowak, Liu, Zahed '22](#)

Integrated gluon and entropy

Photon can not resolve proton anymore therefore the EE vanishes.

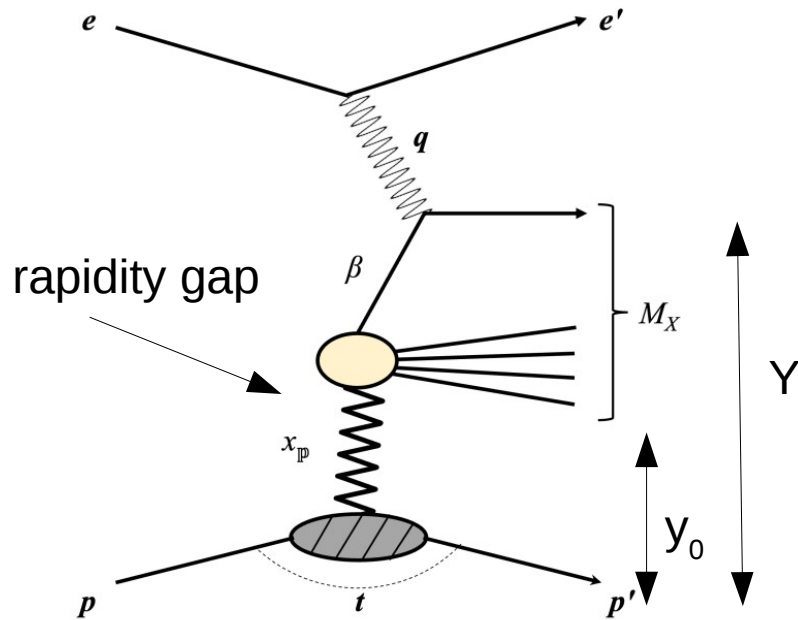

But it might be that the formalism breaks down for low scales.

There might be another source of entropy that keep the total entropy not vanishing → **generalized second law Bekenstein**

$$\lim_{Q^2 \gg Q_s^2} S(x, Q^2) = \ln(S_{\perp} Q_s^2(x)) + \ln \frac{N_c}{8\alpha_s \pi^2} = \lambda \ln \frac{1}{x} + \text{const}$$

$$\lim_{Q^2 \ll Q_s^2} S(x, Q^2) = \ln \left(\frac{S_{\perp} Q^4}{Q_s^2(x)} \right) + \ln \frac{N_c}{16\alpha_s \pi^2}$$

EE in Diffractive Deep Inelastic Scattering

$x_{\mathbb{P}}$ proton's momentum fraction carried by the Pomeron

β denotes the Pomeron's momentum fraction carried by the quark interacting with the virtual photon

$$x = \beta \cdot x_{\mathbb{P}} \quad \text{Bjorken } x$$

$$y_0 \simeq \ln 1/x_{\mathbb{P}} \quad \text{size of rapidity gap}$$

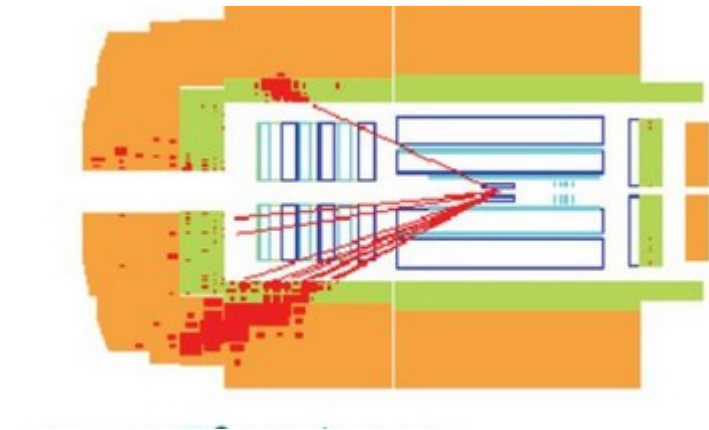

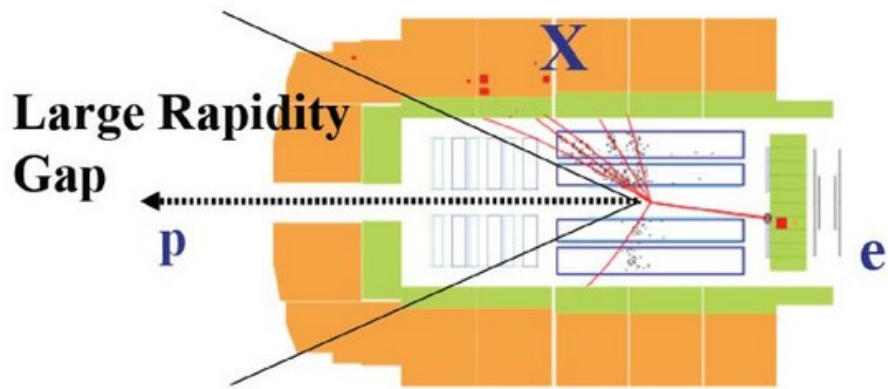

$$Y = \ln 1/x$$

$$y_X = Y - y_0 \simeq \ln 1/\beta$$

Analogous evolution equation as for non-diffractive case but Initial conditions are different and there is delay because of rapidity gap.

Diffraction vs. nondiffraction

H1 detector

EE in DDIS

$$\left\langle \frac{dn(\beta)}{d\beta} \right\rangle_{\text{charged}} \simeq \frac{2}{3} \left\langle \frac{dn(\beta)}{d\beta} \right\rangle$$

$$p_n^D(y_X) = \frac{1}{C} e^{-\Delta y_X} \left(1 - \frac{1}{C} e^{-\Delta y_X} \right)^{n-1}$$

$$p_n \equiv 1/Z$$

H1 data region

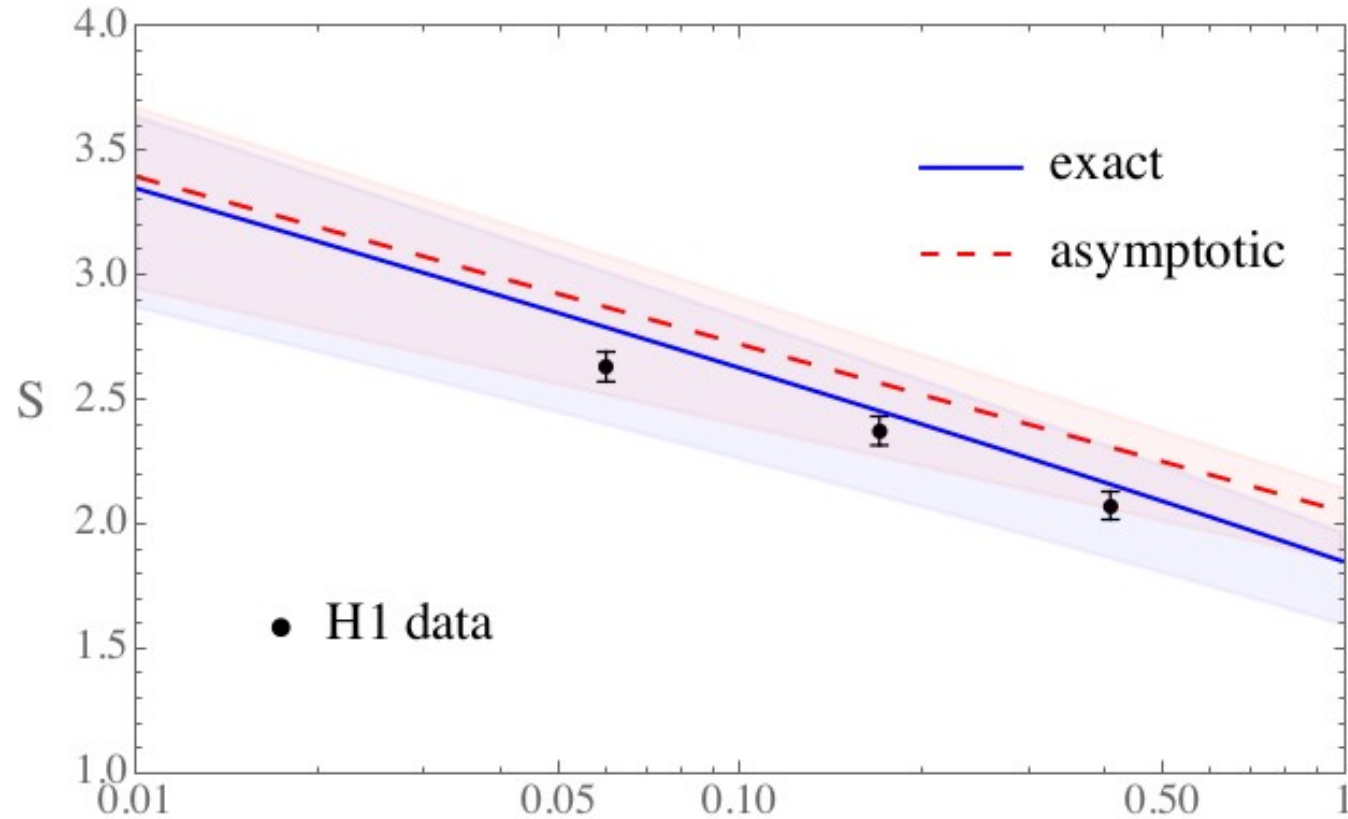

$$S(Z) = - \sum_n p_n \ln p_n = (1 - Z) \ln \frac{Z-1}{Z} + \ln Z$$

$$S_{\text{asym.}}(Z) = \ln Z + 1 + \mathcal{O}(1/Z)$$

Asymptotic or maximal entangled region. All configurations have the same probability

High probability of configurations with few partons

EE in DDIS

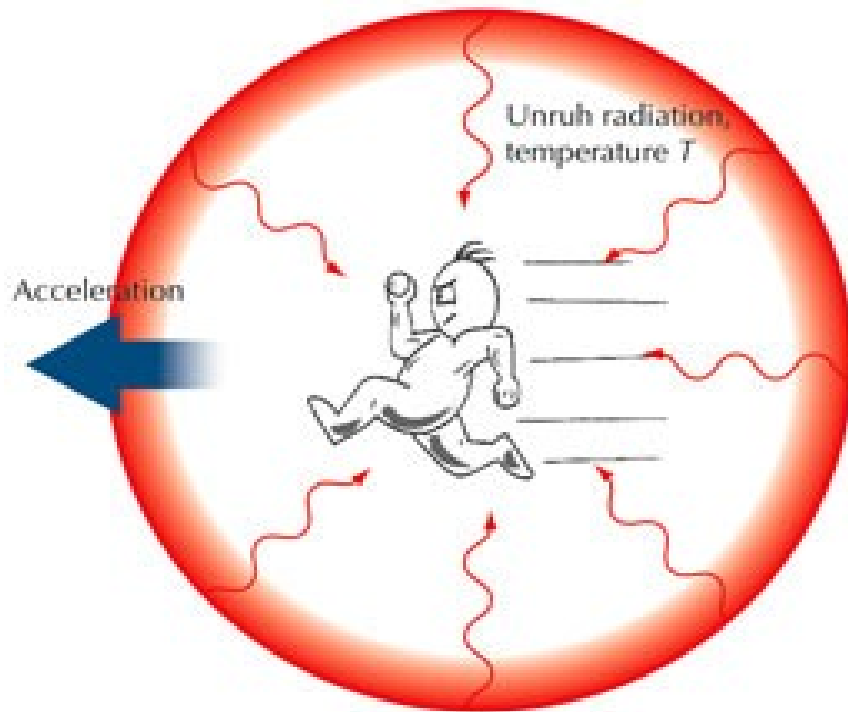

β
momentum fraction carried by the quark interacting with the virtual photon

Conclusions and outlook

- We show evidences for the proposal for low x maximal entanglement entropy of proton constituents .
- It can be systematically improved (quark contributions, NLO BFKL, rc BK) and can describe successfully H1 data.
- We obtain saturation of entropy at small resolution scales.
- We demonstrate that the proposal works for DDIS and that it can be used to study onset of maximal entanglement
- Saturation might be manifestation of provide mechanism for vanishing of EE at low resolution scale
- The thermodynamic based approach agrees with KL approach
- Formal study of dipole cascade model 2404.07657, P. Caputa, K. Kutak it follows that one can view gluon density as a measure of quantum complexity of proton
