Prospects/conclusion

Nucleon structure and GPDs

One of the central aims of hadron physics:
to understand better nucleon's 3D structure.

Nucleon structure and GPDs

One of the central aims of hadron physics:
to understand better nucleon's 3D structure.

- How does the mass of the nucleon arise?
- How does the spin of the nucleon arise? NAS report 2018
- What are the emergent properties of dense systems of gluons?

Nucleon structure and GPDs

One of the central aims of hadron physics:
to understand better nucleon's 3D structure.

- How does the mass of the nucleon arise?
- How does the spin of the nucleon arise? NAS report 2018
- What are the emergent properties of dense systems of gluons?
- Answering these questions is one of the crucial expectations for the upcoming years!
- For this, we need to probe the 3D structure.
- Transverse position of quarks: GPDs.
- Twist-2 GPDs as first aim, but higher-twist of growing importance.
- Both theoretical and experimental input needed.

Nucleon structure and GPDs

One of the central aims of hadron physics:
to understand better nucleon's 3D structure.

- How does the mass of the nucleon arise?
- How does the spin of the nucleon arise? NAS report 2018
- What are the emergent properties of dense systems of gluons?
- Answering these questions is one of the crucial expectations for the upcoming years!
- For this, we need to probe the 3D structure.
- Transverse position of quarks: GPDs.
- Twist-2 GPDs as first aim, but higher-twist of growing importance.
- Both theoretical and experimental input needed.

Generalized parton distributions (GPDs):

- much more difficult to extract than PDFs,
- but they provide a wealth of information:
 - ★ spatial distribution of partons in the transverse plane,
 - ★ mechanical properties of hadrons,
 - ★ hadron's spin decomposition,
- reduce to PDFs in the forward limit, e.g. $H(x, 0, 0) = q(x)$,
- their moments are form factors, e.g. $\int dx H(x, \xi, t) = F_1(t)$.

Partonic structure from Lattice QCD

- Direct access to partonic distributions impossible in LQCD.
- Reason: **Minkowski** metric required, while LQCD works with **Euclidean**.

(experiment) $\text{cross-section} = \text{perturbative-part} * \text{partonic-distribution}$
(lattice) $\text{lattice-observable} = \text{perturbative-part} * \text{partonic-distribution}$
- Which lattice observables one can use?
- Good “lattice cross sections” [Y.-Q. Ma, J.-W. Qiu, Phys. Rev. Lett. 120 (2018) 022003]:
 - ★ computable on the lattice,
 - ★ having a well-defined continuum limit (renormalizable),
 - ★ perturbatively factorizable into PDFs.

Lattice QCD – brief reminder

Lattice QCD – brief reminder

- QCD d.o.f.'s put on a **Euclidean** lattice
 - ★ quarks \rightarrow sites
 - ★ gluons \rightarrow links
- various discretizations can be used for quarks and gluons

Lattice QCD – brief reminder

- QCD d.o.f.'s put on a **Euclidean** lattice
 - ★ quarks → sites
 - ★ gluons → links
- various discretizations can be used for quarks and gluons
- typical lattice parameters:
 - ★ $L/a = 32, 48, 64, 80, 96, 128$
 - ★ $a \in [0.04, 0.15]$ fm
 - ★ $L \in [2, 10]$ fm
 - ★ $m_\pi L \geq 3 - 4$

Lattice QCD – brief reminder

- QCD d.o.f.'s put on a **Euclidean** lattice
 - ★ quarks → sites
 - ★ gluons → links
- various discretizations can be used for quarks and gluons
- typical lattice parameters:
 - ★ $L/a = 32, 48, 64, 80, 96, 128$
 - ★ $a \in [0.04, 0.15]$ fm
 - ★ $L \in [2, 10]$ fm
 - ★ $m_\pi L \geq 3 - 4$
 - ★ $\Rightarrow \infty$ -dim path integral $\rightarrow 10^8 - 10^9$ -dim integral
- Monte Carlo simulations to evaluate the discretized path integral
- feasible, but still requires huge computational resources of $\mathcal{O}(1 - 1000)$ million core-hours, depending on the question asked

Lattice QCD – brief reminder

- QCD d.o.f.'s put on a **Euclidean** lattice
 - ★ quarks → sites
 - ★ gluons → links
- various discretizations can be used for quarks and gluons
- typical lattice parameters:
 - ★ $L/a = 32, 48, 64, 80, 96, 128$
 - ★ $a \in [0.04, 0.15]$ fm
 - ★ $L \in [2, 10]$ fm
 - ★ $m_\pi L \geq 3 - 4$
 - ★ $\Rightarrow \infty$ -dim path integral $\rightarrow 10^8 - 10^9$ -dim integral
- Monte Carlo simulations to evaluate the discretized path integral
- feasible, but still requires huge computational resources of $\mathcal{O}(1 - 1000)$ million core-hours, depending on the question asked
- Lattice QCD offers a way for a careful *ab initio* study of non-perturbative aspects of QCD.
- Its huge strength: possibility to control all systematic effects: *cut-off effects, finite volume effects, renormalization quark mass effects, isospin breaking, excited states, ...*
- Precision studies vs. exploratory studies.

Quasi-distributions

X. Ji, *Parton Physics on a Euclidean Lattice*, Phys. Rev. Lett. **110** (2013) 262002

Euclidean matrix element:

$$\langle P_f | \bar{\psi}(z) \Gamma \mathcal{A}(z, 0) \psi(0) | P_i \rangle$$

Its Fourier transform (quasi-distribution) can be matched onto the light-cone distribution:

(Large Momentum Effective Theory (LaMET))

$$\tilde{q}(x, \mu, P_3) = \int_{-1}^1 \frac{dy}{|y|} C\left(\frac{x}{y}, \frac{\mu}{P_3}\right) q(y, \mu) + \mathcal{O}\left(\Lambda_{\text{QCD}}^2/P_3^2, M_N^2/P_3^2\right)$$

quasi-PDF
pert.kernel
PDF
higher-twist effects

Quasi-distributions

X. Ji, *Parton Physics on a Euclidean Lattice*, Phys. Rev. Lett. **110** (2013) 262002

Euclidean matrix element:

$$\langle P_f | \bar{\psi}(z) \Gamma \mathcal{A}(z, 0) \psi(0) | P_i \rangle$$

Its Fourier transform (quasi-distribution) can be matched onto the light-cone distribution:

(Large Momentum Effective Theory (LaMET))

$$\underbrace{\tilde{q}(x, \mu, P_3)}_{\text{quasi-PDF}} = \int_{-1}^1 \frac{dy}{|y|} \underbrace{C\left(\frac{x}{y}, \frac{\mu}{P_3}\right)}_{\text{pert. kernel}} \underbrace{q(y, \mu)}_{\text{PDF}} + \mathcal{O}\left(\frac{\Lambda_{\text{QCD}}^2}{P_3^2}, \frac{M_N^2}{P_3^2}\right)_{\text{higher-twist effects}}$$

Dirac structures Γ for different GPDs:

VECTOR: γ_0, γ_3 : H, E (unpolarized twist-2),

γ_1, γ_2 : G_1, G_2, G_3, G_4 (vector twist-3).

AXIAL VECTOR: $\gamma_5 \gamma_0, \gamma_5 \gamma_3$: \tilde{H}, \tilde{E} (helicity twist-2),

$\gamma_5 \gamma_1, \gamma_5 \gamma_2$: $\tilde{G}_1, \tilde{G}_2, \tilde{G}_3, \tilde{G}_4$ (axial vector twist-3).

TENSOR: $\gamma_1 \gamma_3, \gamma_2 \gamma_3$: $H_T, E_T, \tilde{H}_T, \tilde{E}_T$ (transversity twist-2),

$\gamma_1 \gamma_2$: H'_2, E'_2 (tensor twist-3).

Need different projectors to disentangle 2/4 GPDs

UNPOL: $\mathcal{P} = \frac{1+\gamma_0}{4}$

POL- k : $\mathcal{P} = \frac{1+\gamma_0}{4} i \gamma_5 \gamma_k$

- Summary

Lattice setup:

- fermions: $N_f = 2$ twisted mass fermions + clover term
- gluons: Iwasaki gauge action, $\beta = 1.778$
- gauge field configurations generated by ETMC
- lattice spacing $a \approx 0.093$ fm,
- $32^3 \times 64 \Rightarrow L \approx 3$ fm,
- $m_\pi \approx 260$ MeV.

Kinematics:

- three nucleon boosts: $P_3 = 0.83, 1.25, 1.67$ GeV,
- momentum transfers: $-t \leq 2.76$ GeV², most data: $-t = 0.64, 0.69$ GeV²,
- skewness: $\xi = 0, 1/3$.

$\mathcal{O}(20000)$ measurements (≈ 250 confs, 8 source positions, 8 permutations of $\vec{\Delta}$).

Standard symmetric (Breit) frame:

source momentum: $P_i = (E, \vec{P} - \vec{\Delta}/2)$,

sink momentum: $P_f = (E, \vec{P} + \vec{\Delta}/2)$.

Lattice perspective:

construction of the 3-point correlation functions required for the MEs needs the calculation of the all-to-all propagator

preferred way: “sequential propagator” – implies separate inversions (most costly part!) for each P_f .

Hence, separate calculation for each momentum transfer $\vec{\Delta}$!

Asymmetric frame:

source momentum: $P_i = (E_i, \vec{P} - \vec{\Delta})$,

sink momentum: $P_f = (E_f, \vec{P})$.

Lattice perspective:

Several momentum transfer vectors $\vec{\Delta}$ can be obtained within a single calculation!

Lorentz-covariant parametrization

Main theoretical tool:

S. Bhattacharya et al., PRD106(2022)114512

Lorentz-covariant parametrization of matrix elements (e.g. vector case):

$$F^\mu(z, P, \Delta) = \bar{u}(p', \lambda') \left[\frac{P^\mu}{m} A_1 + m z^\mu A_2 + \frac{\Delta^\mu}{m} A_3 + i m \sigma^{\mu z} A_4 + \frac{i \sigma^{\mu \Delta}}{m} A_5 + \frac{P^\mu i \sigma^{z \Delta}}{m} A_6 + \frac{z^\mu i \sigma^{z \Delta}}{m} A_7 + \frac{\Delta^\mu i \sigma^{z \Delta}}{m} A_8 \right] u(p, \lambda),$$

(inspired by: S. Meissner, A. Metz, M. Schlegel, JHEP08(2009)056).

- most general parametrization in terms of 8 linearly-independent Lorentz structures,
- 8 Lorentz-invariant amplitudes $A_i(z \cdot P, z \cdot \Delta, \Delta^2, z^2)$.

Lorentz-covariant parametrization

Main theoretical tool:

S. Bhattacharya et al., PRD106(2022)114512

Lorentz-covariant parametrization of matrix elements (e.g. vector case):

$$F^\mu(z, P, \Delta) = \bar{u}(p', \lambda') \left[\frac{P^\mu}{m} A_1 + m z^\mu A_2 + \frac{\Delta^\mu}{m} A_3 + i m \sigma^{\mu z} A_4 + \frac{i \sigma^{\mu \Delta}}{m} A_5 + \frac{P^\mu i \sigma^{z \Delta}}{m} A_6 + \frac{z^\mu i \sigma^{z \Delta}}{m} A_7 + \frac{\Delta^\mu i \sigma^{z \Delta}}{m} A_8 \right] u(p, \lambda),$$

(inspired by: S. Meissner, A. Metz, M. Schlegel, JHEP08(2009)056).

- most general parametrization in terms of 8 linearly-independent Lorentz structures,
- 8 Lorentz-invariant amplitudes $A_i(z \cdot P, z \cdot \Delta, \Delta^2, z^2)$.

Example: (γ_0 insertion, unpolarized projector)

symmetric frame:

$$\Pi_0^s(\Gamma_0) = C \left(\frac{E(E+m) - P_3^2}{2m^3} A_1 + \frac{(E+m)(-E^2 + m^2 + P_3^2)}{m^3} A_5 + \frac{EP_3(-E^2 + m^2 + P_3^2)z}{m^3} A_6 \right),$$

asymmetric frame:

$$\begin{aligned} \Pi_0^a(\Gamma_0) = C \left(- \frac{(E_f + E_i)(E_f - E_i - 2m)(E_f + m)}{8m^3} A_1 - \frac{(E_f - E_i - 2m)(E_f + m)(E_f - E_i)}{4m^3} A_3 + \frac{(E_i - E_f)P_3 z}{4m} A_4 \right. \\ \left. + \frac{(E_f + E_i)(E_f + m)(E_f - E_i)}{4m^3} A_5 + \frac{E_f(E_f + E_i)P_3(E_f - E_i)z}{4m^3} A_6 + \frac{E_f P_3(E_f - E_i)^2 z}{2m^3} A_8 \right). \end{aligned}$$

- matrix elements $\Pi_\mu(\Gamma_\nu)$ are **frame-dependent**,
- but the amplitudes A_i are **frame-invariant**.

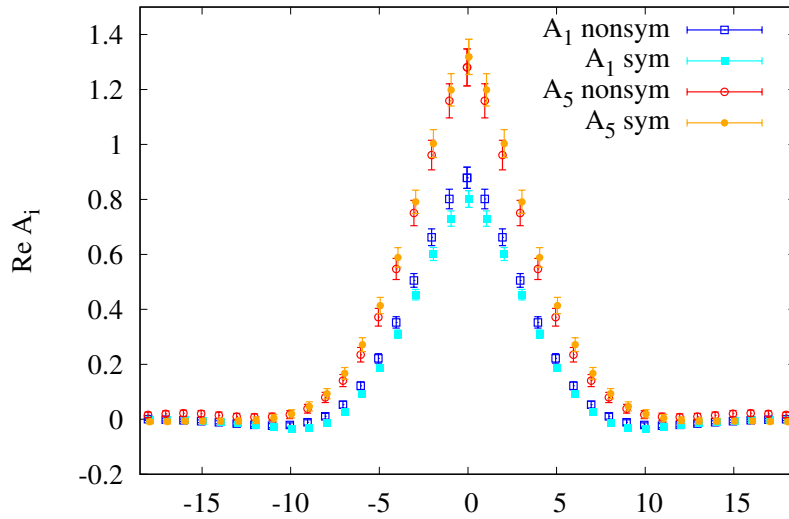

Proof of concept (comparison between frames)

A_1, A_5 (leading ones)

$A_2, A_3, A_4, A_6, A_7, A_8$ (suppressed ones)

S. Bhattacharya et al., PRD106(2022)114512

H and E GPDs – possible definitions

Defining H and E GPDs in the standard way, expressions are frame-dependent:

SYMMETRIC frame:

$$F_{H(0)} = A_1 + \frac{z(\Delta_1^2 + \Delta_2^2)}{2P_3} A_6,$$

$$F_{E(0)} = -A_1 + 2A_5 + \frac{z(4E^2 - \Delta_1^2 - \Delta_2^2)}{2P_3} A_6.$$

ASYMMETRIC frame:

$$F_{H(0)} = A_1 + \frac{\Delta_0}{P_0} A_3 + \frac{m^2 z \Delta_0}{2P_0 P_3} A_4 + \frac{z(\Delta_0^2 + \Delta_\perp^2)}{2P_3} A_6 + \frac{z(\Delta_0^3 + \Delta_0 \Delta_\perp^2)}{2P_0 P_3} A_8,$$

$$F_{E(0)} = -A_1 - \frac{\Delta_0}{P_0} A_3 - \frac{m^2 z (\Delta_0 + 2P_0)}{2P_0 P_3} A_4 + 2A_5 - \frac{z(\Delta_0^2 + 2P_0 \Delta_0 + 4P_0^2 + \Delta_\perp^2)}{2P_3} A_6 - \frac{z \Delta_0 (\Delta_0^2 + 2\Delta_0 P_0 + 4P_0^2 + \Delta_\perp^2)}{2P_0 P_3} A_8.$$

H and E GPDs – possible definitions

Defining H and E GPDs in the standard way, expressions are frame-dependent:

SYMMETRIC frame:

$$F_{H(0)} = A_1 + \frac{z(\Delta_1^2 + \Delta_2^2)}{2P_3} A_6,$$

$$F_{E(0)} = -A_1 + 2A_5 + \frac{z(4E^2 - \Delta_1^2 - \Delta_2^2)}{2P_3} A_6.$$

ASYMMETRIC frame:

$$F_{H(0)} = A_1 + \frac{\Delta_0}{P_0} A_3 + \frac{m^2 z \Delta_0}{2P_0 P_3} A_4 + \frac{z(\Delta_0^2 + \Delta_\perp^2)}{2P_3} A_6 + \frac{z(\Delta_0^3 + \Delta_0 \Delta_\perp^2)}{2P_0 P_3} A_8,$$

$$F_{E(0)} = -A_1 - \frac{\Delta_0}{P_0} A_3 - \frac{m^2 z (\Delta_0 + 2P_0)}{2P_0 P_3} A_4 + 2A_5 - \frac{z(\Delta_0^2 + 2P_0 \Delta_0 + 4P_0^2 + \Delta_\perp^2)}{2P_3} A_6 - \frac{z \Delta_0 (\Delta_0^2 + 2\Delta_0 P_0 + 4P_0^2 + \Delta_\perp^2)}{2P_0 P_3} A_8.$$

One can also modify the definition to make it Lorentz-invariant and arrive at:

ANY frame:

$$F_H = A_1,$$

$$F_E = -A_1 + 2A_5 + 2zP_3 A_6.$$

With respect to the standard definition, removed/reduced contribution from A_3, A_4, A_6, A_8 .

In terms of matrix elements: standard definition – only $\Pi_0(\Gamma_0), \Pi_0(\Gamma_{1/2})$,

LI definition – additionally: $\Pi_{1/2}(\Gamma_3)$ (both frames), $\Pi_{1/2}(\Gamma_3), \Pi_{1/2}(\Gamma_0), \Pi_1(\Gamma_2), \Pi_2(\Gamma_1)$ (asym.).

All kinematic cases (asymmetric frame):

- $\Delta = (1, 0, 0) \Rightarrow -t = 0.17 \text{ GeV}^2$,
- $\Delta = (1, 1, 0) \Rightarrow -t = 0.33 \text{ GeV}^2$,
- $\Delta = (2, 0, 0) \Rightarrow -t = 0.64 \text{ GeV}^2$,
- $\Delta = (2, 1, 0) \Rightarrow -t = 0.79 \text{ GeV}^2$,
- $\Delta = (2, 2, 0) \Rightarrow -t = 1.22 \text{ GeV}^2$,
- $\Delta = (3, 0, 0) \Rightarrow -t = 1.36 \text{ GeV}^2$,
- $\Delta = (3, 1, 0) \Rightarrow -t = 1.49 \text{ GeV}^2$,
- $\Delta = (4, 0, 0) \Rightarrow -t = 2.24 \text{ GeV}^2$,

Helicity GPDs

Lorentz-covariant parametrization of matrix elements (axial vector case):

$$F[\gamma^\mu \gamma_5] = \bar{u}(p', \lambda') \left[\frac{i\epsilon^{\mu P z \Delta}}{m} A_1 + \gamma^\mu \gamma_5 A_2 + \gamma_5 \left(\frac{P^\mu}{m} A_3 + m z^\mu A_4 + \frac{\Delta^\mu}{m} A_5 \right) + m \not{z} \gamma_5 \left(\frac{P^\mu}{m} A_6 + m z^\mu A_7 + \frac{\Delta^\mu}{m} A_8 \right) \right] u(p, \lambda)$$

S. Bhattacharya et al., PRD109(2024)034508

Two definitions of \tilde{H} :

standard ($\gamma_5 \gamma_3$ operator): $F_{\tilde{H}} = A_2 + z P_3 A_6 - m^2 z^2 A_7$,

another ($\gamma_5 \gamma_i$ operators, $i = 0, 1, 2$): $F_{\tilde{H}} = A_2 + z P_3 A_6$.

Both Lorentz-invariant!

\tilde{E} seems impossible to extract at zero skewness: $F_{\tilde{E}} = 2 \frac{P \cdot z}{\Delta \cdot z} A_3 + 2 A_5$.

A_2, A_5 (leading ones)

$zA_1, A_3, zA_4, zA_6, z^2A_7, zA_8$ (suppressed ones)

Conclusions and prospects

Introduction

Results

Summary

- Main message: **probing nucleon's 3D structure with LQCD becomes feasible!**
- Recent breakthrough for GPDs: **computationally more efficient calculations in non-symmetric frames.**
- Also, new definitions of GPDs with different convergence properties – e.g. faster convergence for the unpolarized GPD E .
- A lot of follow-up work in progress: transversity GPDs, pion and kaon GPDs, other twist-3 GPDs, extension of kinematics.
- Obviously, GPDs much more challenging than PDFs.
- Several challenges have to be overcome – control of lattice and other systematics.
- Consistent progress will ensure complementary role to pheno!

LORENTZ-INVARIANT DEFINITION

Twist-3

PDFs/GPDs can be classified according to their twist, which describes the order in $1/Q$ at which they appear in the factorization of structure functions.

LT: **twist-2** – probability densities for finding partons carrying fraction x of the hadron momentum.

Twist-3:

QUASI	TMF	$m_\pi = 260 \text{ MeV}$	$a = 0.093 \text{ fm}$
-------	-----	---------------------------	------------------------

- no density interpretation,
- contain important information about qgq correlations,
- appear in QCD factorization theorems for a variety of hard scattering processes,
- have interesting connections with TMDs,
- important for JLab's 12 GeV program + for EIC,
- however, measurements very difficult.

Exploratory studies:

- matching for twist-3 PDFs: g_T, h_L, e

PRD108(2023)054501

Consistency checks

Burkhardt-Cottingham-type sum rules:

$$G_P(t) = \int_{-1}^1 dx (\tilde{E}(x, \xi, t) + \tilde{G}_1(x, \xi, t)) = \int_{-1}^1 dx \tilde{E}(x, \xi, t) \quad \Rightarrow \int_{-1}^1 dx \tilde{G}_i(x, \xi, t) = 0$$

$$G_A(t) = \int_{-1}^1 dx (\tilde{H}(x, \xi, t) + \tilde{G}_2(x, \xi, t)) = \int_{-1}^1 dx \tilde{H}(x, \xi, t)$$

GPD	$P_3 = 0.83$ [GeV] $-t = 0.69$ [GeV ²]	$P_3 = 1.25$ [GeV] $-t = 0.69$ [GeV ²]	$P_3 = 1.67$ [GeV] $-t = 0.69$ [GeV ²]	$P_3 = 1.25$ [GeV] $-t = 1.38$ [GeV ²]	$P_3 = 1.25$ [GeV] $-t = 2.76$ [GeV ²]
\tilde{H}	0.741(21)	0.712(27)	0.802(48)	0.499(21)	0.281(18)
$\tilde{H} + \tilde{G}_2$	0.719(25)	0.750(33)	0.788(70)	0.511(36)	0.336(34)

- satisfied for $\tilde{H} + \tilde{G}_2$ – same local limit and norm as \tilde{H} ,
- cannot be tested for $\tilde{E} + \tilde{G}_1$ – \tilde{E} inaccessible at $\xi = 0$.
- norms of \tilde{G}_2 and \tilde{G}_4 close to vanishing.

Efremov-Leader-Teryaev-type sum rules:

$$\int dx x \tilde{G}_3(x, \xi, t) = \frac{\xi}{4} G_E(t), \quad \int_{-1}^1 dx x \tilde{G}_4(x, \xi, t) = \frac{1}{4} G_E(t).$$

- \tilde{G}_3 indeed vanishes at $\xi = 0$,
- \tilde{G}_4 non-vanishing and small.

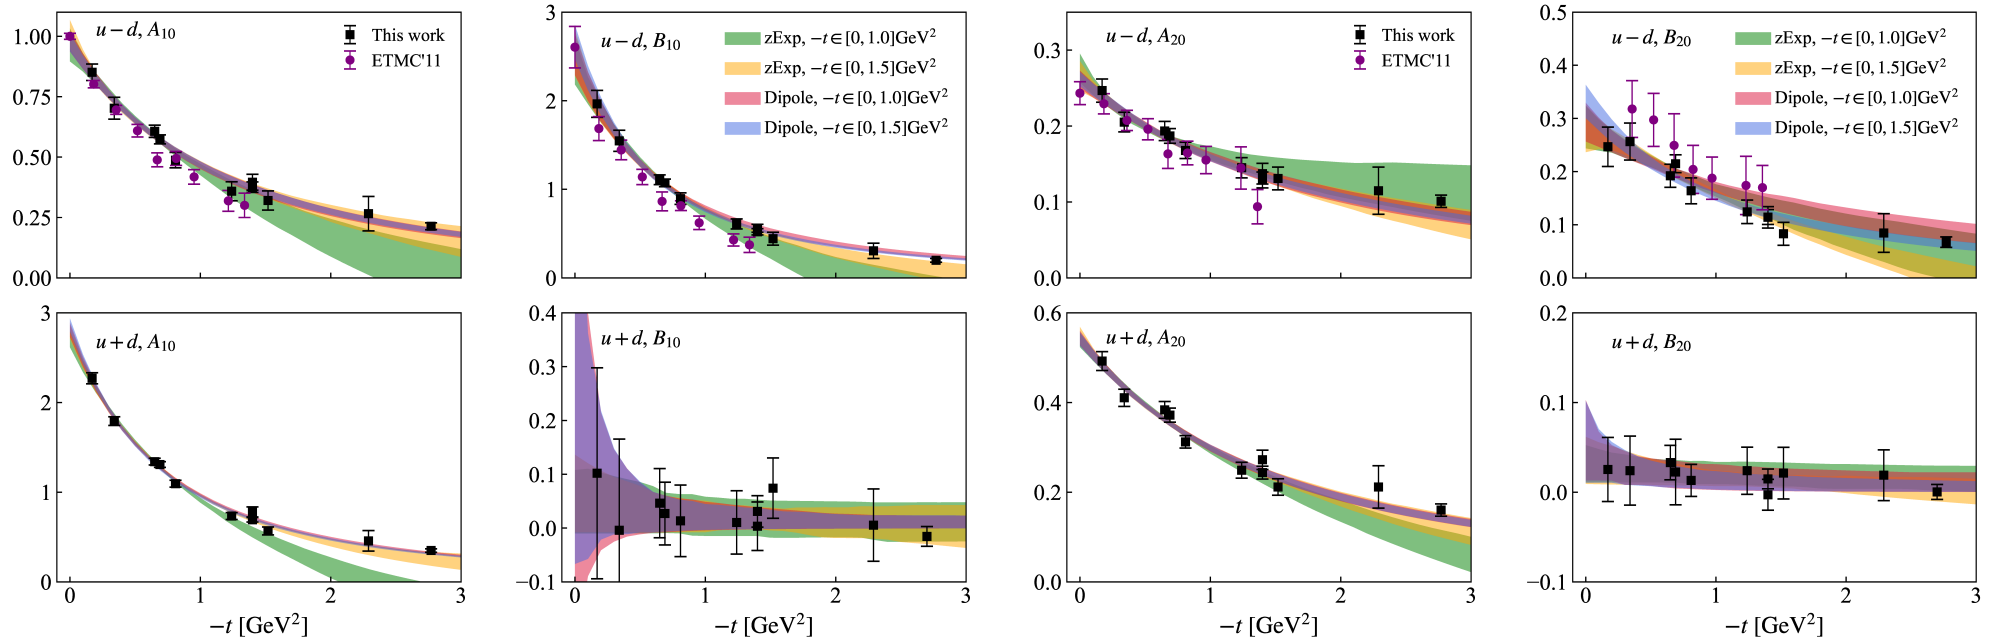

GPDs moments from OPE of non-local operators

Short-distance factorization of ratio-renormalized H/E :

$$\mathcal{F}^{\overline{\text{MS}}}(z, P, \Delta) = \sum_{n=0} \frac{(-izP)^n}{n!} C_n^{\overline{\text{MS}}}(\mu^2 z^2) \langle x^n \rangle + \mathcal{O}(\Lambda_{\text{QCD}}^2 z^2),$$

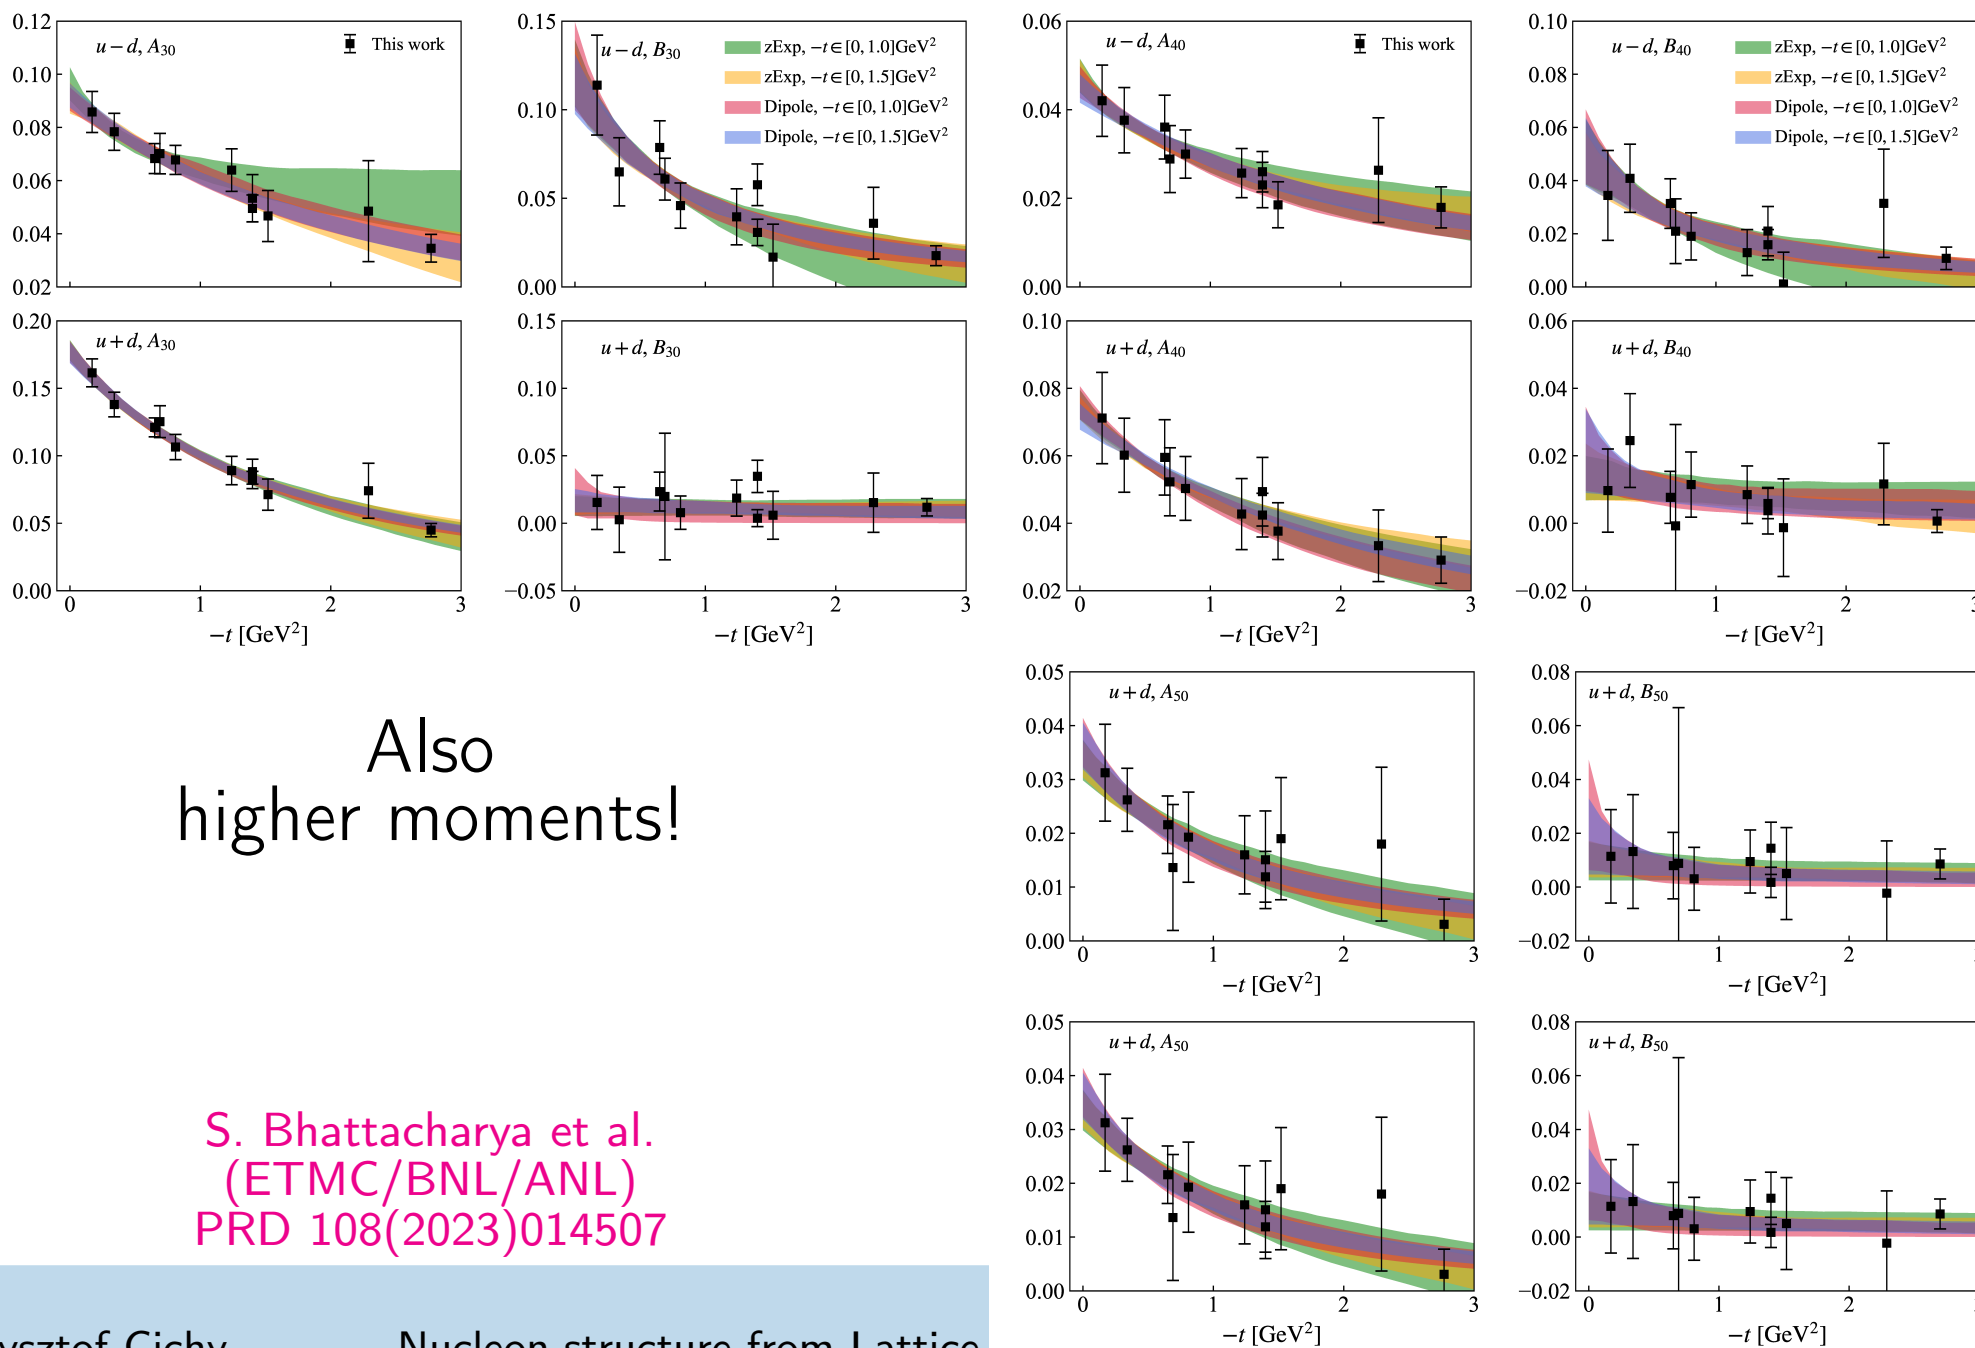

$C_n^{\overline{\text{MS}}}(\mu^2 z^2)$ – Wilson coefficients (NNLO for $u - d$, NLO for $u + d$)

S. Bhattacharya et al. (ETMC/BNL/ANL) PRD 108(2023)014507

GPDs moments from OPE of non-local operators

Also
